Choice Reaction Time

selection, and response execution. The task involves making a specific, speeded response to each of two or more stimuli that are presented in succession. For example, subjects could make an "not keypress when a circle appears and a "z" keypress when a square appears. Like the simple RT to this task's basic processes are not thought to be core self-regulatory measures. Therefore, this to can be used to investigate whether any relationships between self-regulatory tasks are also shad		
Type Behavioral Duration (min) 5 Description Subjects press one of two buttons for one stimulus and the other button for the other stimulus. OSF Link https://osf.io/br2c9/ Adult/Child adult Computerized Identified 1 The Choice RT task measures the basic cognitive processes of perception, discrimination, response election, and response execution. The task involves making a specific, speeded response to ear of two or more stimuli that are presented in succession. For example, subjects could make an "In keypress when a circle appears and a "z" keypress when a square appears. Like the simple RT to this task's basic processes are not thought to be core self-regulatory measures. Therefore, this to can be used to investigate whether any relationships between self-regulatory tasks are also shawith choice RT, which would suggest that the relationship in question arose as a result of these overlapping basic processes like discrimination. The main dependent measure is the speed and accuracy of the speeded responses.	Title	Choice Reaction Time

Adult/Child adult Computerized Identified 1 The Choice RT task measures the basic cognitive processes of perception, discrimination, responselection, and response execution. The task involves making a specific, speeded response to each of two or more stimuli that are presented in succession. For example, subjects could make an "nakeypress when a circle appears and a "z" keypress when a square appears. Like the simple RT to this task's basic processes are not thought to be core self-regulatory measures. Therefore, this to can be used to investigate whether any relationships between self-regulatory tasks are also show with choice RT, which would suggest that the relationship in question arose as a result of these overlapping basic processes like discrimination. The main dependent measure is the speed and accuracy of the speeded responses.	Description	Subjects press one of two buttons for one stimulus and the other button for the other stimulus.
Identified Identified Ithe Choice RT task measures the basic cognitive processes of perception, discrimination, response selection, and response execution. The task involves making a specific, speeded response to each of two or more stimuli that are presented in succession. For example, subjects could make an "new keypress when a circle appears and a "z" keypress when a square appears. Like the simple RT to this task's basic processes are not thought to be core self-regulatory measures. Therefore, this to can be used to investigate whether any relationships between self-regulatory tasks are also show with choice RT, which would suggest that the relationship in question arose as a result of these overlapping basic processes like discrimination. The main dependent measure is the speed and accuracy of the speeded responses.	OSF Link	https://osf.io/br2c9/
