Supporting Documentation Identified Tex PMCID, PUBMED ID, or Exp	Goals often diverge from natural, automatic tendencies, and the Stroop task is a seminal and robust measure of this ability to overcome automatic tendencies to respond in accordance with current goals, thought to be an essential component of self-regulation. On each trial, a color word (e.g., 'red", "blue") is presented in one of multiple ink colors. Subjects are instructed to respond based upon the ink color of the word, not the identity of the word itself. When the color and the word are congruent (e.g., "red" in red ink), the natural tendency to read the word facilitates performance, resulting in fast and accurate responding. When the color and the word are incongruent (e.g., "red" in blue ink), the strong, natural tendency to read must be overcome to respond to the ink color. The main dependent measure in the Stroop task is the "Stroop Effect", which is the degree of slowing and the reduction in accuracy on incongruent trials compared to congruent trials.
